

FIBERCO PERFORMANCE REVIEW 2025

Executive Summary

Analysis Period: January - December 2025

EXECUTIVE SUMMARY

FiberCo closed December 2025 with 769 Active CAs across 1,000 homepasses, equal to 76.9% penetration. Monthly lease revenue reached IDR 101.3 million. Performance improved throughout the year, but results remain uneven across technologies, access models, and fibernodes.

Key Metrics

Metrics	December 2025
Total Homepasses	1000
Active CA	769
Overall Penetration	76.9%
Lease Revenue	IDR 101.3M
Media Attach Rate	46.81%

Key Findings

- Existing assets should be optimized before further expansion.
FTTH recorded 75.10% penetration, IDR 99,000 revenue per homepass, and IDR 7.32 million capex per Active CA. HFC performed better at 81.49% penetration, IDR 107,000 revenue per homepass, and IDR 6.72 million capex per Active CA.
- Open access delivered stronger monetization.
Open access areas reached 82.67% penetration, compared with 59.60% in previously exclusive areas. Multi-ISP areas generated IDR 128,800 revenue per homepass, while single ISP areas generated IDR 89,400.
- Media bundles materially increased customer revenue.
Customers with media generated IDR 274,600 combined ARPU, compared with IDR 131,700 for customers without media. The current media attach rate is 46.81%, leaving further room for upselling.

Six Month Priorities

- Increase penetration across five underperforming fibernodes from 59.60% to 70%.
- Run controlled multi ISP pilots and limit exclusivity based on performance.
- Add at least 29 media CAs in North Jakarta and West Jakarta.

Management takeaway:

FiberCo should improve returns from its existing infrastructure and customer base before pursuing broad network expansion.

PERFORMANCE FINDINGS

Infrastructure and Utilization

HFC continued to outperform FTTH in both penetration and monetization. In December 2025, HFC reached 81.49% penetration, compared with 75.10% for FTTH. HFC also generated IDR 107,000 revenue per homepass, above FTTH at IDR 99,000.

Five fibernodes F708541, F951618, F737809, F125728, and F926002 remained among the lowest-penetration nodes in all 12 periods. Together, they represent 250 homepasses and 149 Active CAs, equal to only 59.60% penetration.

The utilization issue is therefore concentrated in specific nodes. Targeted customer acquisition, service quality improvements, and Servco performance reviews should produce faster returns than broad infrastructure expansion.

Servco and Access Model

In December 2025, XLS was the largest lease revenue contributor, with 175 Active CAs, 65.06% penetration, and IDR 24.5 million lease revenue. XLS met its 25% minimum guarantee throughout the year and ended December 40.06 percentage points above the requirement.

MMA recorded 162 Active CAs and 60.67% penetration, followed by SURGE with 157 Active CAs and 60.38% penetration. Although all Servcos recorded a small decline in Active CAs during December, their year-end results remained well above January levels.

Across the 250 homepasses that were previously exclusive, penetration increased from 24.00% in June to 56.40% in December after the exclusive period ended. Revenue per homepass also increased from IDR 33,600 to IDR 79,500.

Multi ISP areas reached 73.33% homepass penetration and IDR 128,800 revenue per homepass. Single-ISP areas reached 68.00% penetration and IDR 89,400 revenue per homepass. These results support gradual access expansion, although they do not prove that competition was the only cause of improvement.

Media Monetization

A total of 360 out of 769 Active CAs subscribed to media products, resulting in a 46.81% attach rate. MMA recorded the highest Servco attach rate at 51.85%, while TETRA recorded the lowest at 40.94%.

Central Jakarta had the highest regional attach rate at 53.52%. North Jakarta had the lowest at 39.34%, followed by West Jakarta at 44.14%.

Catchplay generated the highest total add-on margin at IDR 2.37 million. Sport Pack recorded the highest margin rate at 45.31%.

Customers with media generated IDR 274,600 combined ARPU, representing a 108.57% uplift over the lease ARPU of media customers. Media bundling therefore provides a meaningful revenue contribution.

STRATEGIC RECOMMENDATIONS

1. Recover Five Underperforming Fibernodes

FiberCo should increase combined penetration across the five identified nodes from 59.60% to 70% within six months. This requires an increase from 149 to 175 Active CAs, or 26 additional Active CAs.

Actions

- Set acquisition targets by fibernode and Servco.
- Review service issues, installation quality, and activation lead times.
- Monitor penetration and lease revenue monthly.
- Delay expansion capex in these areas until utilization improves.

2. Pilot Multi-ISP and Limit Exclusivity

Multi ISP access should be tested on low-utilization nodes. Each pilot should be measured using active homepasses, lease revenue per homepass, churn, and service quality.

Exclusivity should not remain the standard access policy. New exclusive agreements should have a limited duration, clear penetration targets, regular reviews, and a clause allowing FiberCo to open access when targets are missed.

3. Increase Targeted Media Upselling

North Jakarta could add 18 media CAs, while West Jakarta could add 11 media CAs if both regions move closer to Central Jakarta's 53.52% attach-rate benchmark.

Actions

- Use MMA's upselling approach as the benchmark.
- Prioritize Catchplay for total margin and Sport Pack for margin rate.
- Assign media attach-rate targets to each Servco.
- Measure campaigns using attach rate, media ARPU, add-on margin, and retention.

Policy Decisions

- FTTH expansion (Selective, not aggressive)

FTTH currently trails HFC in penetration, revenue per homepass, and capex efficiency. Expansion should be limited to areas with proven demand and clear capacity requirements.

- Exclusivity (Limited and performance based)

Exclusive access should only be granted for a defined period with measurable penetration targets and regular reviews.

- Multi ISP competition (Encourage through controlled pilots)

Initial pilots should focus on areas with low utilization and weak monetization.

- Media bundling (Expand selectively)

North Jakarta and West Jakarta should be the first priority, with MMA used as the upselling benchmark.

Analysis Notes

- Penetration is calculated using Active CAs divided by total homepasses.
- Media analysis uses active customers as of December 2025 because the media data does not include transaction dates.
- The full net profit impact of media cannot be calculated because base CATV package costs are unavailable.
- Access model comparisons show association, not direct causation.
